

PROJECT OVERVIEW

MarketFlow turns daily trader activity into cash-flow clarity.

A Django + React prototype for Nigerian market traders, covering authentication, daily sales, expenses, inventory, dashboard analytics, reports, and a documented reconstruction path for deeper accounting correctness.

React 19

FRONTEND

Django 6

BACKEND API

JWT + Session

AUTHENTICATION

NGN

TRADER FINANCE

The product is focused on informal traders who need simple records without losing accounting discipline.

1

Record

Capture sales, expenses, inventory, and business profile information from practical daily workflows.

2

Separate

Keep capital, sales, expenses, profit, inventory value, and tax reserve concepts visible to users.

3

Plan

The docs define burn rate, break-even, tax estimates, trends, and forecasting as the next calculation layers.

The implemented app already covers the core operating loop.

IMPLEMENTED SCREENS

Sales, expenses, inventory, reports, and profile are built as separate routed pages.

Sales

Add item name, amount, quantity, and note.
View and delete recent sale records.

/sales

Expenses

Track cost category, amount, and notes.
Expenses feed dashboard and reports.

/expenses

Inventory

Track item, quantity, unit, reorder level, unit cost, stock value, and low-stock state.

/inventory

Reports

Simple profit, current capital, tax set-aside, and weekly sales/expense movement.

/reports

Auth

Email/password register and login, token storage, refresh, logout, and `/auth/me` profile.

/auth

Profile

Account, business, stall, initial capital, and sign-out action.

/profile

The current backend is a working prototype API with user-scoped financial records.

Current models

BusinessProfile stores business name, stall name, and initial capital.

Sale, **Expense**, and **InventoryItem** are linked directly to the authenticated user.

Current endpoints

[/api/dashboard/](#)

[/api/sales/](#)

[/api/expenses/](#)

[/api/inventory/](#)

[/api/auth/register/](#)

[/api/auth/login/](#)

[/api/auth/me/](#)

The reconstruction blueprint moves from prototype boundaries to domain boundaries.

WHAT WE HAVE SO FAR

A useful prototype is in place, and the next work is about correctness, auditability, and business ownership.

Done now

Frontend routing, responsive layouts, auth forms, JWT-aware API client, CRUD screens for sales/expenses/inventory, dashboard summaries, reports, and profile.

Next engineering focus

Characterization tests, business ownership model, transaction domain apps, stock movements, cash/capital ledger, and calculation services.
